This app allows the user to control the lights in their house.

The app has buttons that act as signifiers to control the lights. The on and off button is mapped like a button, which makes it easy for users to use.

The three dots on the right are also a signifier for individual controls, which is commonly used. The icons on the bottom allow the users to switch between the main screen and the settings screen. Tapping each icon will bring you to the corresponding screen, which is intuitively mapped.

At the top of the home screen, we have an index in the form of "edit" which allows users to edit all their lights.

In the settings screen, we have a dropdown menu that allows the user to change which house/set of lights they are controlling. With the symbol of the down arrow acting as the signifier to reveal the dropdown menu.

The screen also has a slider than allows users to adjust the brightness the lights. This is intuitively mapped as sliding the slider to the right brightens the lights and sliding the slider to the left dims the lights.
