When I leave the house, it is common practice, almost a habit for me to turn off all my lights before I leave. This process, however, is fairly tedious as I have to physically hit every light switch in the house. On top of that, there are times where I've forgotten to turn off one or two lights and had to turn back around to turn them off. With that in mind, I created an app to solve this issue. This app is called Lights. It essentially allows the user to control the lights in their house once they are paired. In the home screen, the user can easily see which lights are on or off, and control each light individually.

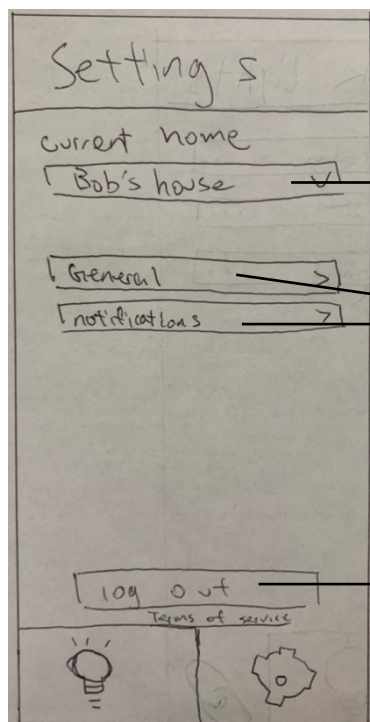

Allows users to edit their lights, rearrange/remove

Allows the user to turn lights on and off

Drop down menu where users can rename or remove that specific light

Allows users to add/link a new light

Settings page with more detailed controls

Allows users to group linked lights into different houses

Brings users to more detailed settings

Log out of their current account
